The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutary1-Conzyme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compound can be used to treat disorders by antichsense therapy. The compound can be used to treat disorders by antichsense therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnosties.
                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     prophylăxis, or as research reagents or kits. This sequence represents a human LIM domain kinase 1 antisense oligonucleotide.

The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It preferred target region on the nucleic acid molecule encoding LIM preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human LIM domain kinase 1 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.

Dobie KW;

New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding cyclin-dependent kinase 4, useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer 19 Query Match Matches 셤 à The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding dual specific phosphatase 6. The compound specifically hybridises with the nucleic acid molecule encoding dual specific phosphatase 6 and inhibits the expression of dual specific phosphatase 6. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule concoming dual specific phosphatase 6. The antisense oligonucleotide is useful for inhibiting the expression of dual specific phosphatase 6 in cells or tissues to treat diseases associated with their expression, such a propriorilerative disorder, a condition arising from aberrant apoptosis, an inflammatory disorder or a developmental disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human dual specific phosphatase 6 antisense oligonucleotide. 0 Gaps o; 0.8%; Score 13.8; DB 1; Length 20; 18.2%; Pred. Use of an agent for preparing a medicament for preventing progression of an invasive disease, for treating malignant forms of cancer or for preventing metastasis of cancer in vivo and tumor progression in vitro and/or in vivo.

Example 1; SEQ ID NO 21; 134pp; English.

The present invention describes an agent which can be used for preparing a medicament for preventing the progression of an invasive disease in an individual, where invasion of cells, other organisms or invasion of cells intension of cancer in vivo and tumour of cancer or for preventing metastasis of cancer in vivo and tumour corporassion in vitro and/or in vivo. The agent comprises (a) an agent cambon in intro and/or in vivo. The agent comprises (a) an agent cambon in family of proteins; (b) an agent capable of inhibiting expression of a polypeptide belonging to the semaphorin family of proteins, where the agent is belonging to the semaphorin family of proteins, where the agent is selected from antibodies or fragments of antibodies directed to the polypeptide, or fragments or variants of fragments of the polypeptide, or fragments or variants of fragments of the polypeptide, or fragments or variants of fragments of the polypeptide, or fragment or a receptor and thereby inhibiting binding of a proteolytic and/or (c) an agent capable of inhibiting binding of a proteolytic convertase; (a) an isolated polyclonal activation of the convertase; (a) an isolated polyclonal or monoclonal antibody compound; or a proprotein convertase and thereby inhibiting the activity of the convertase; (3) an isolated polyclonal or monoclonal antibody compound; (5) a method for diagnosing or prognosing manignant cancer. The agent has expression of an invasive disease, where invasion of convertance, growth disturbance, neuroprotective, cardiant, antimicrobial, in gene therapy. The agent is useful for preparing a medicament for preventing progression of inself plays a role in disease.

Crespiratory, kidney or neoplastic diseases, where invasion of the present sequence represents a reverse transcriptase PCR primer crownerses; of cancer in vivo and tumour progression in vitro and/or in vention.

The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                      Phosphorothicate backbone. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein Kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein Kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER
/note= "OTHER= Phosphorothioate backbone. All cytidines
are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding PCTAIRE protein kinase 2, useful for preparing a composition for treating neurological disorders.

The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of haem oxygenase I such as hyperbilirubinaemia, neonatal jaundice and neurodegenerative diseases like Alzheimer's and Parkinson's disease. The invention is also useful in
                                                                                                                                                                                                                                                   "mod base= OTHER _{\mbox{\scriptsize Table}} " phosphorothioate backbone where all cytidines are

The invention describes a new isolated nucleic acid comprising a fully defined sequence having 23574 bp or at least its 50 or 15 contiguous cucleotides and includes: allele G of single nucleotide polymorphism or (SNP) AB+2; allele G of SNP BG-1; and allele G of SNP BG-2. The invention describes identifying increased susceptibility to a disorder comprising asthma, bronchial hyperresponsiveness, atopy, chronic obstructive lung disease and adult respiratory distress syndrome in a subject comprising testing a biological sample obtained from a subject for the presence of treating a biological sample obtained from a subject for the presence of the presence of the increased susceptibility to the disorder. The cucleic acid is useful for preparing a composition for treating disorders comprising asthma, bronchial hyperresponsiveness, atopy, chronic cobstructive lung disease and adult respiratory distress syndrome. This sequence represents a primer used to detect single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention describes a new isolated nucleic acid comprising a fully defined sequence having 23574 bp or at least its 50 or 15 contiguous nucleotides and includes: allele G of single nucleotide polymorphism (SNP) ABE; allele G of SNP BC+1; and allele C of SNP BC+2. The invention describes identifying increased susceptibility to a disorder comprising at the properties of sathma, bronchial hyperresponsiveness, atopy, chronic obstructive lung disease and adult respiratory distress syndrome in a subject comprising testing a biological sample obtained from a subject for the presence of at least one allele or haplotype given in the specification, where the nucleic acid is useful for preparing a composition for treating disorders comprising asthma, bronchial hyperresponsiveness, acopy, chronic obstructive lung disease and adult respiratory distress syndrome. The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is
            respiratory or lung disease, which involves administering to the dirways of a subject an effective amount of an inhibitor. The oligonuclectide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease is chosen from alrway inflammation, allergy(les), asthma, impeded respirator, cystic fibrosis (CP), chronic obstructive pulmonary diseases (COPD), allergic thinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, alrway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel single or multiple target oligonucleotide anti-sense to e.g.
initiation codons and introns of respiratory disease-relevant genes e.g.,
CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                                                                                                                                                                     The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interleukin, IL-4 receptor, IL-5 receptor; lung disease, airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an oligonucleotide anti-sense to eninitiation codon, coding region with 2-10 nucleotides of 5'-end and end of nucleic acid target comprising gene (8) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the

The invention relates to an insect acetylcholine esterase (ace-1) (1) with a central catalytic region, given in the specification as AbJ93656, or (ii) a sequence 60 % identical or 70 % similar to AbJ93656. Also disclosed is a method for detecting insects that carry resistance to organophosphorus and carbamate insecticides. The method of the invention sessitant to organophosphorus and catbamate insecticides. Ace-1 and transgenic invertebrates that express it, are used to screen for insecticides, i.e. inhibitors of ace-1. The nucleic acid that encodes (1), also antibodies specific for (1), are used to detect insects, that are resistant to organophosphorus and carbamate insecticides. Secondary continuation of ace-1. The nucleic acid that encodes particularly mosquito disease vectors but also agricultural pests, that are resistant to organophosphorus and carbamate insecticides. Agents that are resistant to organophosphorus and carbamate insecticides. Agents that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inhibit (I) are effective against insect strains resistant to organophosphorus and carbamate insecticides. Sequences given in ADJ93657-ADJ93784 represent products of the ace-1 gene (CDNA, protein, AChE1) from various insects, and also primers for the amplification of ace-1 nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Insecticide; acetylcholine esterase; ace-1; organophosphorus; carbamate;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to antisense oligonucleotides which are targetted to nucleic acid molecule encoding phospholipase D2 and the encoding protein. The invention is useful for inhibiting the expression of phospholipase D2 and for treating diseases and conditions associated with expression of phospholipase D2 e.g. hyperproliferative disease such as Alzheimer's disease and Parkinson's disease. The invention is also useful for therapeutic and prophylactic applications to prevent or delay infection, inflammation and tumour formation. The present sequence is human phospholipase D2 target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

```
The present invention relates to antisense oligonucleotides which are targetted to nucleic acid molecule encoding phospholipase D2 and the encoding protein. The invention is useful for inhibiting the expression of phospholipase D2 and for treating diseases and conditions associated with expression of phospholipase D2 e.g. hyperproliferative disorder such as cancer, neurodegenerative disease such as Alzheimer's disease and parkingon's disease. The invention is also useful for therapeutic and prophylactic applications to prevent or delay infection, inflammation and tumour formation. The present sequence is human phospholipase D2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compounds targeted to nucleic acid molecules encoding phospholipase D2, useful for treating diseases associated with expression of phospholipase D2, e.g. cancer, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                    not\,\bar{e}\text{=} "Phosphorothioate backbone where all cytidines are 5'-methylcytidines"

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific cranscription factor. The present invention describes antisense of inkage, a phosphorothiate linkage, at least one modified internucleoside oligonucleotides that comprise at least one modified sugar moiety, as 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, concept, as a speciated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1, such as breast cancer, cut ilphyceridaemia, obesity, hepatitis B virus-mediated acute or chronic triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cycleatic, antilipaemic, antilarterlosclerotic, anorectic, hepatorropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 mucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage, at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar moiety, complycitation. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1 such as breast cancer, complycationary lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated critical antilipaemic, antilatratiosclerotic, ancreatic, antilitammatory and virucidal activities. This correctic, hepatotropic, clitholytic, antilinfammatory and virucidal activities. This colligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in compensive that target a portion of an active site on the nucleic acid composured to the nuclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific composition actor. The present invention describes antisense composition are useful for treatured of linkage, a phosphorothioate linkage; at least one modified internucleoside concept a 2-7-0-methoxycythyl (2' NOE) and at least one modified sugar moiety, an expression of the seast cancer, and agnosing a disease associated with LRH1, such as breast cancer, concept and adjacental actions and condition associated activity, accordingly, these compositions exhibit contained activity, Accordingly, these compositions exhibit contained and an analysis and all and an analysis and virucidal activities of the contained activity and virucidal activities. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                      /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligonucleotide sequence is an antisense DNA oligo used to modulate the

                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LAHI) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LAHI (also known as NEAR). LAHI is a monomeric orphan nuclear receptor protein that functions as a tissue specific configuration factor. The present invention describes antisense coligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified sugar moiety, a 2-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, configuration these antisense compounds are useful for treating or diagnosing a disease associated with LRHI, such as breast cancer, dispipidaemia, atherosclerosis, low HDL (high density lipoprotein), hypercholesterolaemia, gall stones, configurated acute or chronic configuration, as well as hepatocellular carcinoma or a condition associated with aromatese activity. Accordingly, these compositions exhibit cytostatic, antiliflammatory and virucidal activities. This importion is the invention of the modulate the configuration and antisense DNA oligo used to modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Kane CD;

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in molecule encoding LRH1 (also known as NESAS). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-O-methoxyethy! (2' MOE) and at least one modified nucleobase, a 5-methylcytidine. These antisense compounds are useful for treating or mittylcytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, disklipideamia, atherosclerosis, low HDL (high density lipoprotein), high triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antiinflammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention. oligonucleotide

Sequence 20 BP; 7 A; 5 C; 5 G; 3 T; 0 U; 0 Other;

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRBA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific

New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

All cytidine nucleobases are 5-methylcytidine."
transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified sugar moiety, at 0.0 methoxyethyl (2' MOE) and at least one modified sugar moiety, at 0.0 methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-methoxyethyl or these antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, tyslicity anterosciated with LRH1, such as breast cancer, LDL (low density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cycostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antiinflammatory and virucidal activities. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense DNA oligo used to modulate human LRH1 expression SeqID 303.
                                                                                                                                                                                                                                                                                                                                                             Gaps

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in clearth that target a portion of an active site on the nucleic acid molecule encoding LRH1 (laso known as NR5A2). LRH1 is a monomeric orphan complear receptor protein that functions as a tissue specific runlear receptor protein that functions as a tissue specific coligonucleotides that comprise at least one modified internucleoside clinkage, a phosphorothicate linkage; at least one modified internucleoside clinkage, a phosphorothicate linkage; at least one modified sugar moiety, a 2-0-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-cc methylcytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH2, such as breast cancer, complication and a shear or she with a translated acute or chronic triglyceridemia, obesity, hepatitis B virus-mediated acute or chronic curing and an antistant arctinoma or a condition associated with armates antistic manner and antistant antistant and antistic manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRHI) and splice variants therefor Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRHI (also known as NRSA2). LRHI is a monomeric orphan conclude receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-comethoxyethyl at these antisense compounds are useful for treating or diagnosing a disease associated with LRHI, such as breast cancer, dyslipidaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatociallar carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit control of the aromatase activity. Accordingly these compositions exhibit and relations and virusidal activities of the aromatase activity. Accordingly and virusidal activities of the aromatase activity. Accordingly these compositions exhibit and a structure of the aromatase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

```
This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NESA2). LRH1 is a monomeric orphan culled receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified nucleobase, a 2.0-methoxyethyl (2. MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2. MOE) and at least one modified nucleobase, a 5-comethoxyethyl (2. MOE) and at least one modified nucleobase, a 5-comethoxyethyl at antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, constipulatemia, atheroscalerosis, low HDL (high density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic with argument and associated with LHH argument and associated with argument are condition associated with argument and acute or chronic with argument and associated with argument and associated with argument and a secondated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

The present invention relates to antisense compounds targeted to a nucleic acids encoding human and mouse complement component C3. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression
diagnosing a disease associated with LRH1, such as breast cancer, dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high LDL (low density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cycostatic, antilihaemic, antierrisoslerotic, anorectic, hepatotropic, litholytic, antiinflammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; mouse; complement component C3; autoimmune disorder; multiple sclerosis; infection; atherosclerosis; neuroprotective; antiarteriosclerotic; antimicrobial; antiinflammatory; cytostatic;

Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleocases in molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage, at least one modified supar moiety, a 2'-0-methoxyethyl (2' MOB) and at least one modified supar moiety, methylcytidine. These antisense compounds are useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

of complement component C3 in cells. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as autoimmune disorders e.g. multiple sclerosis, infections, and atherosclerosis. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid encoding a CPRA protein, used to increase production of dicarboxylic acid, for use in chemical products including plastics, adhesives, and fragrances.

The composition and methods are useful in diagnosing or treating asthma or bronchial hyperresponsiveness, and other diseases such as obesity or inflammatory bowel disease. The present sequence is used in the exemplification of the
           production, the DNA and protein sequences are useful for increasing production of dicarboxylic acid in chemical products, such as: plastics, adhesives and fragrances. The present DNA sequence represents a PCR primer that was used in an example of the invention.
                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid molecules useful for diagnosing or treati
asthma or bronchial hyperresponsiveness, or other diseases such as
obesity or inflammatory bowel disease.

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This oligonucleotide sequence is a human clone specific PCR primer used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; NOVX; PCR; ss; congenital heart defect; cardiomyopathy; atherosclerosis; hypertension; pulmonary stenosis; scleroderma; adenocarcinoma; haemophilia; graft-versus-host disease; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; multiple sclerosis; diabetes; obesity; bronchial asthma; acquired immunodeficiency syndrome; AIDS; Crohn's disease;

The invention relates to human NOVX polypeptides and the polynucleotides are useful for encoding them. The NOVX polypeptides and polynucleotides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy, atherosclerosis, hypertension, pulmonary stenosis, scleroderma, atherosclerosis, hypertension, pulmonary stenosis, scleroderma, andenocarcinoma, haemophilia, graft-versus-host disease, cancer, neurodegenerative disorders, Alzhaimer's disease, parkinson's disease, immunodeficiency syndrome (ALDS), crohn's disease, preferents a PCR primer used to amplify a human NOVX polynucleotide of the invention. Note: The sequence data for this patent is also available from USPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·;

The present sequence represents a chimeric antisense oligonucleotide cargeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to human mpGES-1 gene is located on chromosome 9, more specifically to present invention also describes: (1) antisense compounds, aggas.). Which specifically hybridise with the nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of inhibits its expression; (2) a method of inhibiting the expression of confition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antiinflammatory, neuroprotective, nootropic, antianthatic, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPCES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of inhibits in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective,

antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheiner's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CCR1, come to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the cone or more nucleic acid target(s) or expressed product(s), for the cone or more nucleic acid target(s) or expressed product(s), for the cone or more nucleic acid target(s) or expressed product(s), for the cone or more nucleic acid target(s) or expiratory or lung disease. The congonical conding interleukin-4 receptor, interleukin-5 receptor, configuration or many and a respiratory or lung disease are useful for reading or treating a respiratory or lung disease. The useful for preventing or treating a respiratory or lung disease. The cuseful for preventing or treating a respiratory or lung disease. The cuseful for reventing or treating a respiratory or lung disease. The cuseful for preventing or treating a respiratory or lung disease. The cuseful for reventing or treating a respiratory or lung disease. The cuseful for preventing or treating a respiratory or lung disease. The cuseful for preventing or treating a respiratory or lung disease. The cuseful for preventing or treating a denosine and/or levels of adenosine A month of the contract of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
                                                                                                                                               Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. The invention relates to SACI polypeptides and the polynucleotides encoding them. The polynucleotides contain a variation associated with sensing carbohydrates, other sweeteners or ethanol. The invention also sensing carbohydrates, other sweeteners or ethanol. The invention also comprising altering SACI activity in the sample and measuring the activity, a method for analysing a polynucleotide in a biological sample, comprising contacting a polynucleotide in a biological sample, with a probe where the probe hybridises to a SACI polynucleotide to form a comprisation complex and detecting the hybridisation complex, a method of identifying susceptibility to obesity or diabetes comprising conparing to mucleotide sequence of the suspected SACI allele with a wild type cucleotide sequence identifies a sequence variation of the SACI and the wild-type sequence identifies a sequence variation of the SACI cucleotide sequence, and a method of treating or preventing obesity, cucleotide sequence, and a method of treating or preventing obesity, cucleotide sequence, and a method of treating or preventing obesity, cucleotide sequence, and a method of treating or preventing obesity, comprises or alcoholism associated with expression of SACI, comprising administering are useful for screening drugs for inhibition or restoration of gene function as antidiabetic, antiobesity or antialcohol consumption therapies and for identifying sweeteners and alcohols. This seconds in a subject and subject a maplify murine SACI DNA of the function.
                                                                                                                                                                                                                                                                               New isolated polynucleotides for sensing carbohydrates, other sweeteners, or ethanol, useful for screening drugs for inhibition or restoration of gene function as antidiabetic, antiobesity or antialcohol consumption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GFAT; Antidiabetic; Cardiant;

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of medulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothoate oligonucleotide with 2' molecular chimeric phosphorothoate oligonucleotide with 2' molecular and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GFAT; Antidiabetic; Cardiant;

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2' MOSE wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                 New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
(GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               transplant rejection; immune system; rheumatoid arthritis; lupus; inflammatory bowel disease; multiple sclerosis; HIV; AIDS; ss; primer.

                                                                                                                                                                                                                 rejection, e.g. cardiac or kidney transplant rejection, in an individual rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic rislet, lung, bone marrow or stem cell transplant rejection, and the method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIVAIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.

The present invention relates to diagnosing or monitoring transplant crejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The comprises detecting the expression level of one or more genes. The comprises detecting the expression level of one or monitoring comethods, system and kits are useful in diagnosing or monitoring cransplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an exportansplant rejection or mechanical organ replacement rejection, in an individual. The methods are also useful in diagnosing and monitoring can individual. The methods are also useful in diagnosing and monitoring classases that involve the immune system, e.g. rheumatoral arthritis, compliant infection. The present sequence represents a crital, bacterial or fungal infection. The present sequence represents a crital or fungal infection. The present sequence represents a configurate rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatcid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonuclectide marker for diagnosis and monitoring of allograft rejection and other disorders.

New compounds, particularly oligonucleotides targeted to a nucleic acid encoding Notch3, useful for treating diseases associated with Notch3, e.g. hyperproliferative disorders.

Example 15; SEQ ID NO 86; 74pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human Notch3 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2.-O-methoxyethy sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Notch3 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Notch3 DNA antisense

The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human presynaptic cytomatrix protein, PCLO, proximal PCR

Identifying a subject at risk of melanoma, useful for treating melanoma, comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a

The invention describes a new compound (I) comprises 8-80 nucleobases in length targeted to a nucleic acid molecule encoding adipophilin, where the compound specifically hybridises with the nucleic acid and inhibits the expression of adipophilin. Also described are: a method of inhibiting the expression of adipophilin. Also described are: a method of inhibiting the expression of adipophilin is of a dispophilin is comprising contacting a sesociated with breast cancer-1, comprising administering (I) to the animal so that expression of adipophilin is inhibited; a method of screening for a modulator of adipophilin, comprising contacting a correct animal so that expression of adipophilin, comprising contacting a concern more candidate modulators, and identifying for one or more candidate modulators, and identifying of cone or more candidate modulators, and identifying a disease state, adipophilin; a diagnostic method for identifying a disease state, adipophilin; a diagnostic method for identifying a disease state, comprising identifying the presence of adipophilin in a sample using at least one of the primers selected from a fully defined sequence of 20, 18 cor assay comprising (I). The methods and compositions of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating diseases or conditions associated with aberrant expression or activity of adipophilin, such as atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                      'note = "OTHER Phosphorothioate backbone. The invention relates to novel antisense compounds targeted to a nucleic acid molecule encoding human Talin to and inhibit its expression. The invention is useful for treating a disease or condition associated with
invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity adipophilin, such as atherosclerosis. This sequence represents a human adipophilin antisense oligonucleotide.
                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Phosphorothioate backbone where all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to
nucleic acid encoding talin, useful for treating muscular, cardiac,
hematologic, or hyperproliferative disorders.

Talin such as a disease or condition e.g. muscular, haematologic, cardiac or hyperproliferative disorder such as cancer. The present sequence is an antisense oilgonucleotide targeted to human Talin DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ŋ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides for modulating NF-kappaB repressing factor expression, useful for diagnosing, preventing or treating diseases or conditions involving an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding NF-kappaB repressing factor (NRF). NF-kappaB (nuclear factor kappaB) is involved in such cellular processes as the immune response, inflammatory response, oncogenesis, apoptosis, cell cycle, differentiation and cell migration. The compound (an antisense oligonucleotide) specifically hybridises with the nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1..20

encoding NRF (which appears as ADP74371 and comprises nucleotides 469701-489000 of the X chromosome containing the NRF gene at Xq24-25) and inhibits the expression of NRF. Also included are inhibiting the expression of NRF in cells or tissues, screening for a modulator of NRF, a diagnostic method for identifying a disease state, a kit or assay device comprising the above compound, and treating an animal having a disease or condition associated with NRF. The antisense oligonucleotide is useful for inhibiting the expression of NRF in cells or tissues to prevent or treat diseases associated with aberrant NRF expression, such as diseases or conditions involving an immune response. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents an antisense oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PPAR-alpha (peroxisome proliferator-activated receptor-alpha), that specifically hybridises with the nucleic acid encoding PPAR-alpha comprising 8601-bp sequence and inhibits expression of PPAR-alpha. Also described are: a method of inhibiting the modulator of PPAR-alpha in cells or tissues; a method of screening for a modulator of PPAR-alpha; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and a method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding the human Angiopoietin-2 polypeptide. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i. e. a phosphorothicate linkage at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Angiopoietin-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; gene therapy; PPAR-alpha; pportoralpha; PPAR-alpha modulator; peroxisome proliferator-activated receptor-alpha spociated disorder; hyperproliferative disorder; mouse; antisense oligonucleotide; antisense technology; ss.
                                                                                                                                                                                                                                                                       polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the murine Angiopoietin-2 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonuclectide compound that inhibits expression of PPAR-alpha,

                                                                                                                                                                                                                                                   The invention describes a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PPAR-alpha (peroxisome proliferator-activated receptor-alpha), that specifically hybridises with the nucleic acid encoding PPAR-alpha comprising 86001-bp sequence and inhibits expression of PPAR-alpha. Also described are: a method of screening the expression of PPAR-alpha, a diagnostic method for identifying the expression of PPAR-alpha; a diagnostic method for identifying a disease modulator of PPAR-alpha; a diagnostic method for identifying a disease treating an animal having a disease or condition associated with PPAR-alpha. The oligonucleotide componed is useful for preparing a composition for treating hyperproliferative disorder e.g. cancer. This sequence represents a mouse peroxisome proliferator-activated receptor-alpha (PPAR-represents a mouse peroxisome proliferator-activated receptor-alpha (PPAR-represents)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
New oligonucleotide compound that inhibits expression of PPAR-alpha, useful for preparing a composition for treating hyperproliferative disorders, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligomeric compound (an antisense oligonucleotide) 8-50 nucleobases in length comprising a sequence complementary to a nucleic acid molecule encoding dual specific phospharatase ( DUST6, phosphorylating Map kinase and extracellular signal related kinase, ERK) appearing as ADP96435. Also included are a composition comprising the oligonucleotide (and a pharmaceutical carrier or diluent) and a method of inhibiting the expression of dual specific phosphatase 6 in cells or tissues comprising contacting the cells or tissues with the antisense oligonucleotide. The oligomeric compound inhibits the expression of dual specific phosphatase 6 by at least 60% and hybridises to nucleobases 369-389, 480-500, 657-677, 713-818, 923-1028, 1196-1216, 12771693, or 1757-1860 in the codding region of $SQ ID NO: 4. The oligomeric compound hybridises to nucleobases 53-195 in the 5'

UTR of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435. The antisense compound is useful for inhibiting the expression of dual specific phosphatase 6 and for treating a disease or condition associated with the expression of dual specific phosphatase 6 (e.g. a hyperproliferative disorder, developmental disorder, neural disorder or a apoptotic disorder. These may also be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, and in the treatment of a disease or disorder, which can be treated by modulating the expression of dual specific phosphatase 6. The DUST6 gene is located on chromosome 12q22-23. The present sequence is an antisense oligonucleotide targeting DUST6.
                                                                                                                                                                                                                                                                 .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ27030-77 are primers. These were used to amplify the claimed hepatitis C virus genes of the invention which could then be inserted into an E. Coli vector. The polypeptides encoded by the vectors were useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods
